Recreation

Prove that $\lfloor (2+\sqrt{3})^n \rfloor$ is odd for all integer $n \geq 0$.

CS61B Lecture #3: Values and Containers

- Labs are normally due at midnight Friday. Last week's is due
- **Today.** Simple classes. Scheme-like lists. Destructive v
  destructive operations. Models of memory.

Values and Containers

- *Values* are numbers, booleans, and pointers. Values never

  3 'a' true  

- *Simple containers* contain values:

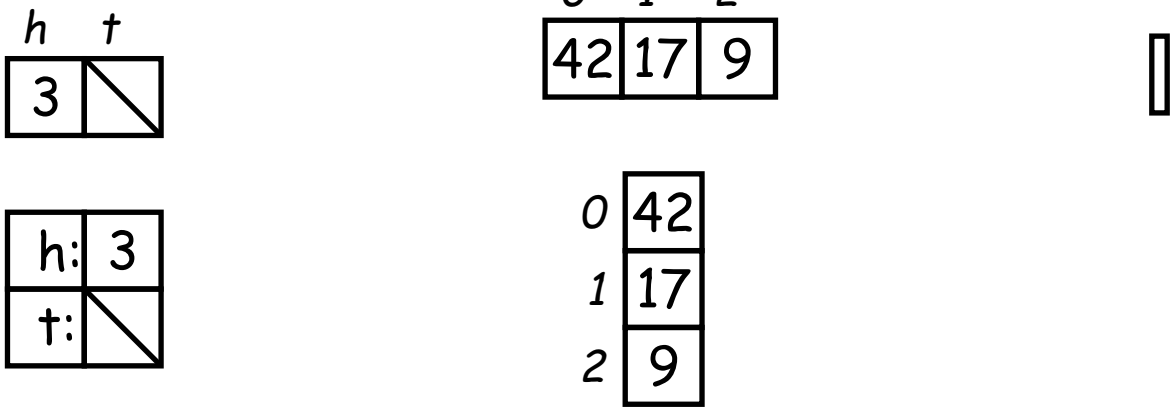
  x:  L:  p: 

  Examples: variables, fields, individual array elements, param

Structured Containers

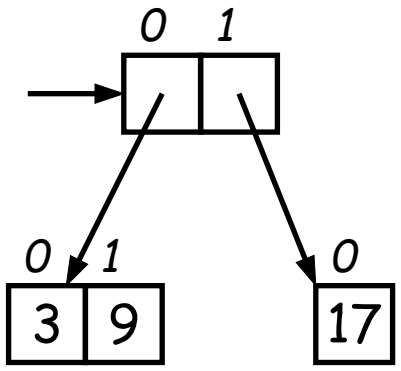
Structured containers contain (0 or more) other containers:

Class Object *Array Object* *Empty Object*



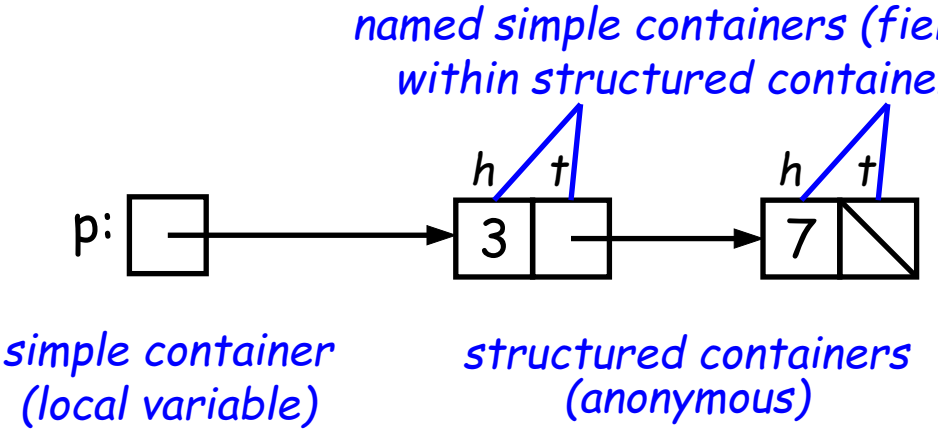
Pointers

- *Pointers* (or *references*) are values that *reference* (point
  tainers.
- One particular pointer, called **null**, points to nothing.
- In Java, structured containers contain only simple contain
  pointers allow us to build arbitrarily big or complex structu
  way.



Containers in Java

- Containers may be *named* or *anonymous*.
- In Java, *all* simple containers are named, *all* structured
  ers are anonymous, and pointers point only to structured con
  (Therefore, structured containers contain only simple cont



- In Java, assignment copies values into simple containers.
- *Exactly* like Scheme and Python!
- (Python also has slice assignment, as in `x[3:7]=...`, which i
  hand for something else entirely.)

Defining New Types of Object

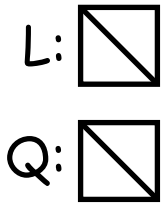
- Class declarations introduce new types of objects.
- Example: list of integers:

```
public class IntList {
  // Constructor function (used to initialize new ob
  /** List cell containing (HEAD, TAIL). */
  public IntList(int head, IntList tail) {
    this.head = head; this.tail = tail;
  }

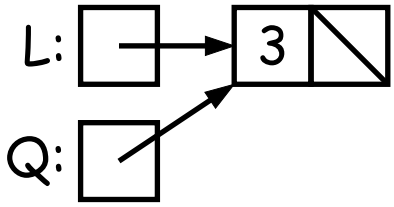
  // Names of simple containers (fields)
  // WARNING: public instance variables usually bad
  public int head;
  public IntList tail;
}
```

Primitive Operations

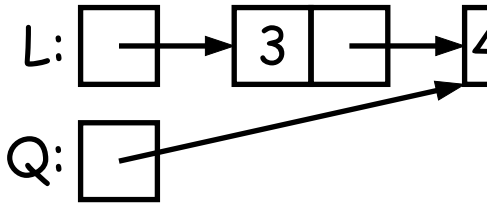
```
IntList Q, L;
```



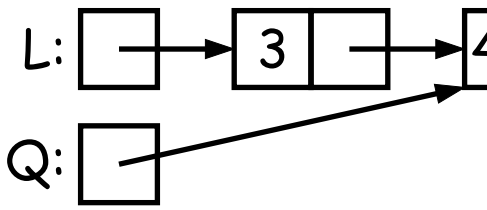
```
L = new IntList(3, null);
Q = L;
```



```
Q = new IntList(42, null);
L.tail = Q;
```

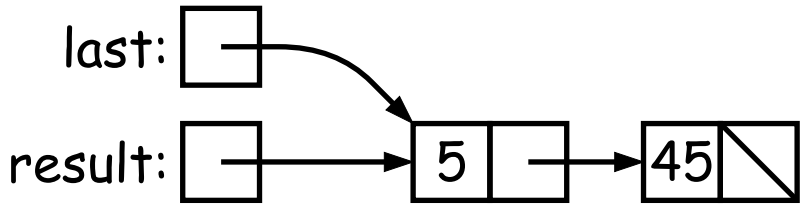


```
L.tail.head += 1;
// Now Q.head == 43
// and L.tail.head == 43
```

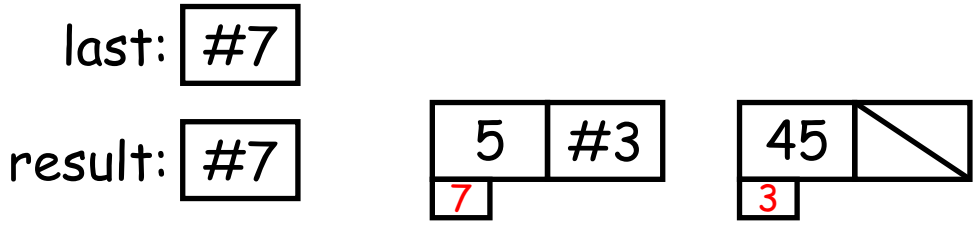


Side Excursion: Another Way to View Pointer

- Some folks find the idea of "copying an arrow" somewhat od
- Alternative view: think of a pointer as a *label*, like a street a
- Each object has a permanent label on it, like the address p a house.
- Then a variable containing a pointer is like a scrap of pape street address written on it.
- One view:

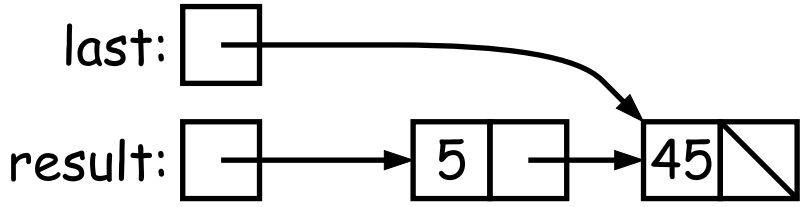


- Alternative view:

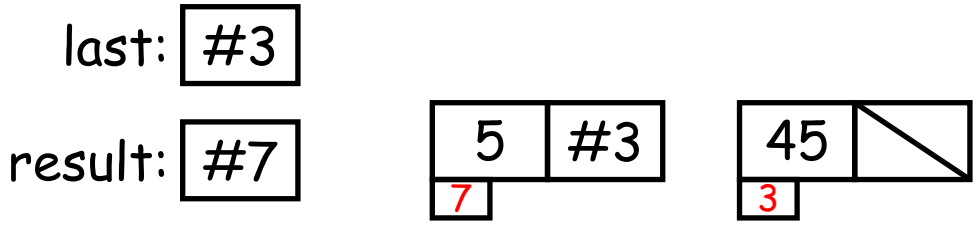


Another Way to View Pointers (II)

- Assigning a pointer to a variable looks just like assigning an
to a variable.
- So, after executing "last = last.tail;" we have



- Alternative view:



- Under alternative view, you might be less inclined to think
signment would change object #7 itself, rather than just "l
- BEWARE! Internally, pointers really are just numbers, b
treats them as more than that: they have *types,* and you c
change integers into pointers.

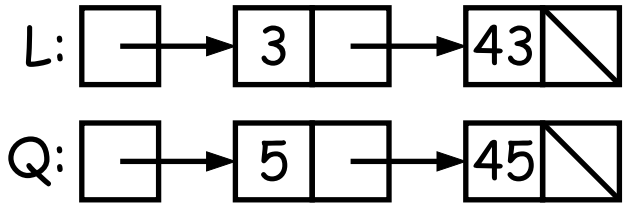
Destructive vs. Non-destructive

Problem: Given a (pointer to a) list of integers, L, and an int
crement n, return a list created by incrementing all elements of
by n.

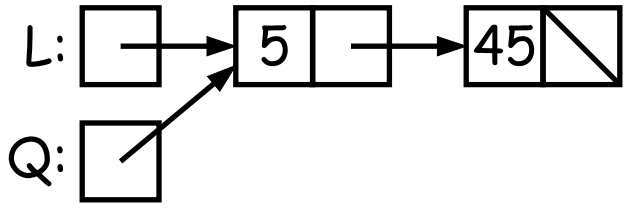
```
/** List of all items in P incremented by n. Does r
 *  existing IntLists. */
static IntList incrList(IntList P, int n) {
    return /*( P, with each element incremented by
}
```

We say `incrList` is *non-destructive,* because it leaves the input
unchanged, as shown on the left. A *destructive* method may mo
input objects, so that the original data is no longer available, a
on the right:

After `Q = incrList(L, 2)`:



After `Q = dincrList(L, 2)`



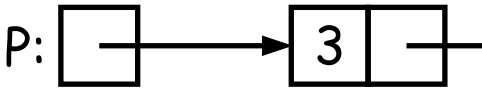
Nondestructive IncrList: Recursive

```
/** List of all items in P incremented by n. */
static IntList incrList(IntList P, int n) {
  if (P == null)
    return null;
  else return new IntList(P.head+n, incrList(P.tai
}
```

- Why does `incrList` have to return its result, rather than j
ting `P`?
- In the call `incrList(P, 2)`, where `P` contains 3 and 43, which
object gets created first?

An Iterative Version

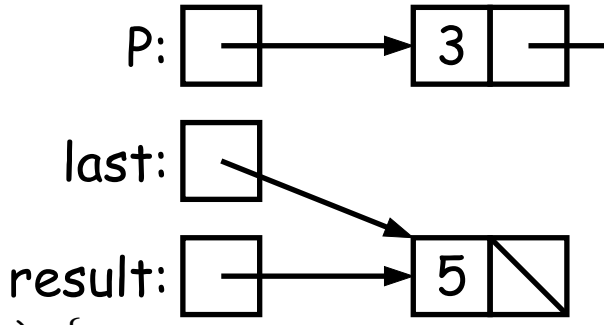
An iterative `incrList` is tricky, because it is *not* tail recursive.
Easier to build things first-to-last, unlike recursive version:



```
static IntList incrList(IntList P, int n) {
  if (P == null)          <<<
    return null;
  IntList result, last;
  result = last
     = new IntList(P.head+n, null);
  while (P.tail != null) {
    P = P.tail;
    last.tail
      = new IntList(P.head+n, null);
    last = last.tail;
  }
  return result;
}
```

An Iterative Version

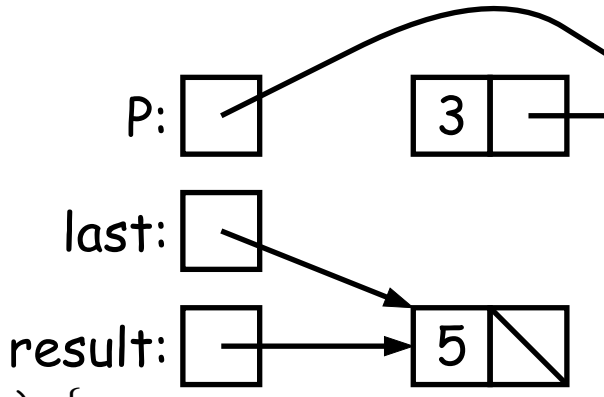
An iterative `incrList` is tricky, because it is *not* tail recursive.
Easier to build things first-to-last, unlike recursive version:



```
static IntList incrList(IntList P, int n) {
  if (P == null)
    return null;
  IntList result, last;
  result = last        <<<
     = new IntList(P.head+n, null);
  while (P.tail != null) {
    P = P.tail;
    last.tail
      = new IntList(P.head+n, null);
    last = last.tail;
  }
  return result;
}
```

An Iterative Version

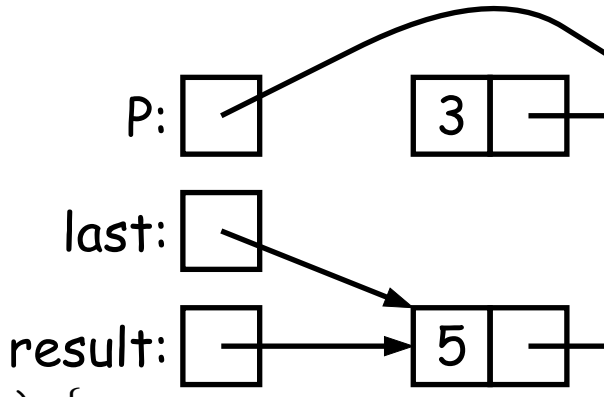
An iterative `incrList` is tricky, because it is *not* tail recursive.
Easier to build things first-to-last, unlike recursive version:



```
static IntList incrList(IntList P, int n) {
  if (P == null)
    return null;
  IntList result, last;
  result = last
     = new IntList(P.head+n, null);
  while (P.tail != null) {
    P = P.tail;          <<<
    last.tail
      = new IntList(P.head+n, null);
    last = last.tail;
  }
  return result;
}
```

An Iterative Version

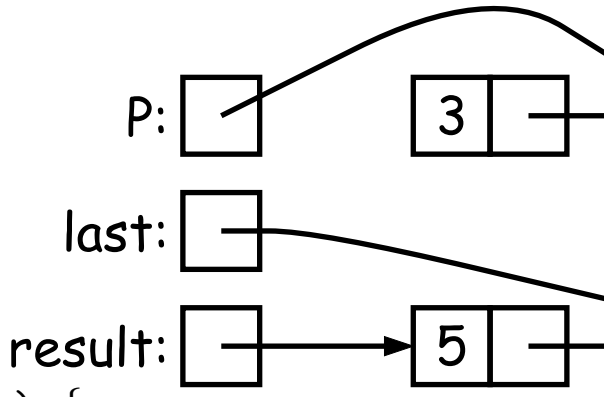
An iterative `incrList` is tricky, because it is *not* tail recursive.
Easier to build things first-to-last, unlike recursive version:



```
static IntList incrList(IntList P, int n) {
  if (P == null)
    return null;
  IntList result, last;
  result = last
     = new IntList(P.head+n, null);
  while (P.tail != null) {
    P = P.tail;
    last.tail          <<<
      = new IntList(P.head+n, null);
    last = last.tail;
  }
  return result;
}
```

An Iterative Version

An iterative `incrList` is tricky, because it is *not* tail recursive.
Easier to build things first-to-last, unlike recursive version:



```
static IntList incrList(IntList P, int n) {
  if (P == null)
    return null;
  IntList result, last;
  result = last
     = new IntList(P.head+n, null);
  while (P.tail != null) {
    P = P.tail;
    last.tail
      = new IntList(P.head+n, null);
    last = last.tail; <<<
  }
  return result;
}
```

An Iterative Version
