

Lecture #7: Object-Based Programming

ed programs are organized primarily around the funcnds, etc.) that do things. Data structures (objects) are eparate.

d programs are organized around the types of objects d to represent data; methods are grouped by type of

ng-system example:

All (Maybe) in CS61A: The Account Class

```
self, balance0):
    balance = balance0

(self, amount):
    balance += amount
    self.balance

(self, amount):
    balance < amount:
        raise ValueError \
            ("Insufficient funds")
    self.balance -= amount
    self.balance

unt(1000)
(balance)
t(100)
raw(500)

public class Account {
    public int balance;
    public Account(int balance0) {
        this.balance = balance0;
    }
    public int deposit(int amount) {
        balance += amount; return balance;
    }
    public int withdraw(int amount) {
        if (balance < amount)
            throw new IllegalStateException
                ("Insufficient funds");
        else balance -= amount;
        return balance;
    }
}

Account myAccount = new Account(1000);
print(myAccount.balance)
myAccount.deposit(100);
myAccount.withdraw(500);
```

The Pieces

ation defines a new type of object, i.e., new type of ontainer.

riables such as balance are the simple containers within s (fields or components).

thods, such as deposit and withdraw are like ordinary ods that take an invisible extra parameter (called this).

rator creates (instantiates) new objects, and initializes onstructors.

s such as the method-like declaration of Account are ods that are used only to initialize new instances. They guments from the new expression.

ction picks methods to call. For example,

```
myAccount.deposit(100)
```

all the method named deposit that is defined for the ed to by myAccount.

Recreation

$$\log(1+x) = x - \frac{1}{2}x^2 + \frac{1}{3}x^3 - \dots$$

case that

$$+ 1/3 - 1/4 + 1/5 - 1/6 + 1/7 - 1/8 + 1/9 - \dots$$

$$3 + 1/5 + 1/7 + 1/9 + \dots - (1/2 + 1/4 + 1/6 + 1/8 + \dots)$$

$$3 + 1/5 + 1/7 + 1/9 + \dots + (1/2 + 1/4 + 1/6 + 1/8 + \dots)$$

$$+ 1/4 + 1/6 + 1/8 + \dots$$

$$2 + 1/3 + 1/4 + \dots - (1 + 1/2 + 1/3 + 1/4 + \dots)$$

Philosophy

970s and before): An abstract data type is possible values (a domain), plus operations on those values (or their containers). for example, the domain was a set of pairs: (head,tail), s an int and tail is a pointer to an IntList. operations consisted only of assigning to and accessing ls (head and tail). e prefer a purely procedural interface, where the funcnds) do everything—no outside access to the internal on (i.e., instance variables). plementor of a class and its methods has complete conavior of instances. preferred way to write the "operations of a type" is as hods.

You Also Saw It All in CS61AS

```
account balance0)
    s (balance 0))

    e balance0))

    it amount)
    e (+ balance amount))

    raw amount)
    ce amount)
    nsufficient funds")

    alance (- balance amount))
    )) )

int
account 1000))
'balance)
'deposit 100)
'withdraw 500)

public class Account {
    public int balance;
    public Account(int balance0) {
        balance = balance0;
    }
    public int deposit(int amount) {
        balance += amount; return balance;
    }
    public int withdraw(int amount) {
        if (balance < amount)
            throw new IllegalStateException
                ("Insufficient funds");
        else balance -= amount;
        return balance;
    }
}

Account myAccount = new Account(1000);
myAccount.balance
myAccount.deposit(100);
myAccount.withdraw(500);
```

Class Variables and Methods

want to keep track of the bank's total funds.

is not associated with any particular Account, but is class-wide. In Java, "class-wide" \equiv static.

```
class Account {  
  
    static int _funds = 0;  
    int deposit(int amount) {  
        _funds += amount;  
        return _funds; // or this._funds or Account._funds  
    }  
  
    static int funds() {  
        return _funds; // or Account._funds  
    }  
  
    // Also change withdraw.  
}
```

Now, can refer to either Account.funds() or to _funds() (same thing).

CS61B: Lecture #7 8

Calling Instance Method

```
// Equivalent of deposit instance method. */  
void deposit(final Account this, int amount) {  
    _funds += amount;  
    return _funds;  
}
```

The instance-method call myAccount.deposit(100) is like a fictional static method:

```
Account.deposit(myAccount, 100);
```

The instance method, as a convenient abbreviation, one can leave leading 'this.' on field access or method call if not. Unlike Python)

CS61B: Lecture #7 10

Constructors

To control objects of some class, you must be able to set their contents.

A constructor is a kind of special instance method that is called by the JVM right after it creates a new object, as if

IntList(1,null) \Rightarrow $\left\{ \begin{array}{l} \text{tmp} = \text{pointer to } \boxed{0} \\ \text{tmp.setInt}(1, \text{null}); \\ \text{L} = \text{tmp}; \end{array} \right.$

11:30 2019

CS61B: Lecture #7 12

Getter Methods

Problem with Java version of Account: anyone can assign to field

loses the control that the implementor of Account has over uses of the balance.

Now public access only through methods:

```
class Account {  
    private int _balance;  
  
    int balance() { return _balance; }  
}
```

Account._balance = 1000000 is an error outside Account.

Convention of putting '_' at the start of private instance variables to distinguish them from local variables and non-private variables. You could actually use balance for both the method and the field, but please don't.)

11:30 2019

CS61B: Lecture #7 7

Instance Methods

Method such as

```
void deposit(int amount) {  
    _funds += amount;  
    return _funds;  
}
```

or of like a static method with hidden argument:

```
void deposit(final Account this, int amount) {  
    _funds += amount;  
    return this._funds;  
}
```

explanatory: Not real Java (not allowed to declare final is real Java; means "can't change once initialized.")

11:30 2019

CS61B: Lecture #7 9

'Instance' and 'Static' Don't Mix

Static methods don't have the invisible this parameter, so can't use to refer directly to instance variables in them:

```
static int badBalance(Account A) {  
    return A._balance; // This is OK  
                        // (A tells us whose balance)  
} _balance; // WRONG! NONSENSE!
```

Account._balance here equivalent to this._balance, meaningless (whose balance?)

It makes perfect sense to access a static (class-wide) field from an instance method or constructor, as happened with the deposit method.

One of each static field, so don't need to have a 'this' in just name the class (or use no qualification inside the method, as you've been doing).

11:30 2019

CS61B: Lecture #7 11

Instructors and Instance Variables

variables initializations are moved inside constructors that
with `this(...)`.

```

{
    5;

    y) {
        iff(y);
    }

    Foo(int y) {
        x = 5;
        DoStuff(y);
    }

    Foo() {
        this(42); // Assigns to x
    }
}

```

Constructors and Default Constructors

have constructors. In the absence of any explicit constructor, the compiler will generate a **default constructor**, as if you had written:

```
class Foo {
c Foo() { }
```

loaded constructors possible, and they can use each other (though the syntax is odd):

```
class IntList {
c IntList(int head, IntList tail) {
this.head = head; this.tail = tail;
```

```
public IntList(int head) {
    this(head, null); // Calls first constructor.
}
```

Summary: Java vs. Python

Java	Python
<pre> ...;) . } ..) } int y = 21; void g(...) } </pre>	<pre> class Foo: ... x = ... def __init__(self, ...): ... def f(self, ...): ... y = 21 # Referred to as Foo.y @staticmethod def g(...): ... </pre>
<pre>) </pre>	<pre> aFoo.f(...) aFoo.x Foo(...) self # (typically) </pre>
